                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets outcled acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatry, antiallactic, antialized; and analogasic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impedder respiratory inespiratory distress syndrome, pain, cystic fibrosis, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers such as leukaemias, lymphomas, carcinomas, and cancer: The reduction of the adenosine content of the consest and prostate cancer. The reduction of the adenosine receptors causing bronchoconstriction and inflammation. A3213 to A3512 represent the conclected sequences given in the sequence listing from the present invention, which correspond to SEO ID NO:1 to 2815, and then the last affect from the present the sequences are also called SEO ID NO:1 to 2815, and then the last affect from the present and process are also called SEO ID NO:1 to 2815, and then the last affect from the present and process and antial and analogas and antial and antial and antial and antial and antial and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       differ from the previously named sequences. SEQ ID NO:11 to 1680 (A32323 to A33923 are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the

                                                                                                                                                                                                                                                                                                                                                             An approx. 400 bp DNA fragment derived from a Pst/PvuII restriction digest of the mouse P600 cDNA clone was isolated. This fragment, which encompasses most of the coding region of the mouse P600 cDNA, was radioactively labelled and hybridised with filter lifts prepd. from a cDNA library made from a clone of an AlO T cell line. One clone, designated PA 10.66, was subcloned into M13 and sequenced. This sequence encodes human IL-13.

surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis; Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -Disclosure; Page 1334-1335; 1592pp; English. 24-MAR-2000; 2000WO-US08020 EAST CAROLINA. WPI; 2000-679539/66 (UYEC-) UNIV EAST WO200062736-A2 Homo sapiens 06-APR-1999; 26-0CT-2000 cancer; 

The present invention describes low adenosine (A) content antisense oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides the A is replaced by a 'universal' or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonuclectides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with a lung/respiratory disorders and malignancies, such as stimulating and activity of target polypeptides associated with a numonoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, immunoglobulins and antibodies and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(les) and of the antisense or contrains the antisense or contrains the antisense or contrains and malignance and contrains and antisense or contrains and contrains and contrains and contrains and contrains and antisense or contrains and condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. F18434 to F21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the present invention

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or anticlestination. The ON can have antiinflammatory, antiallergic, anticlasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including construction and prostate cancer. The reduction of the adenosine content of the construction and inflammation, A3213 represent the construction of the construction and inflammation, and assistance adenosine receptors causing construction and inflammation, and as the construction of the construction of the construction and inflammation. A3213 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (A32323 to A33992) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the 6952 BP; 1536 A; 2017 C; 1919 G; 1480 T; 0 other; sequence listing

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                Sequence 15,

```
Sequences encoding canine interleuse. Light connected and 78 respectively. The invention relates to canine confering a canine or feline (D154 (CD40 ligand), canine LL-5, canine LL-13, feline colony-stimulating factor (GMCSF), and nucleotides which encode these interferon-alpha (IRN-alpha) and feline granulocyte macrophage accounty-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins way be used as uncleic acids, specific antibodies and inhibitors may be used as a vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including a liergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

and 78 respectively. The invention relates to canine and 78 respectively. The invention relates to canine and 78 respectively. The invention relates to canine CD16.

IL-4, canine or feline FIL-3 ligand, canine IL-3, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (GMCSF), and nuclectides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, 121 cagaatcaggcatccctctgcaacggcagcatggtgtggagcgtcaacctgaccgccggc 180 211 331 151 241 acccagaggatgctgaaagcactgtgctctcaaaagcccgcgggcagggatttccagtgaa 300 cgcagccgagacaccaaaattgaagtgatccagttggtgaaaaacctgctcacctatgta 360 91 Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease 61 agecetgtgaetecetececaaceeteaaggageteattgaggagetggteaacateace 181 atgtactgcgcagctctagaatctctgatcaatgtctccgactgcagcgccatccaaagg 1 atggcgctctggttgactgtggtcattgctctcacctgcctcggtggccttgcctccccg ö Length 390; Indels Sequences Z5552-Z55560 and Z55561-Z55566 represent cDNA Sequence 390 BP; 82 A; 99 C; 117 G; 92 T; 0 other; 100.0%; Score 390; DB 21; 100.0%; Pred. sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
CC feline CD154 (CD40 ligand), canine or feline CD40, canine or
CC feline CD154 (CD40 ligand), canine IL-13, feline
CC feline CD154 (CD40 ligand), canine IL-3, canine IL-13, feline
CC finerferon-1alpia (IRN-alpha) and feline granulocyte macrophage
CC colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and incleotides and bundans).
CC mucleic acids, specific antibodies and inhibitors may be used as
cresponse in animals (particularly cats, dogs, horses and humans).
CC They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
cc an also be used for the recombinant production of a protein, while
can also as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
CC The proteins may be used to raise antibodies and to screen for
condulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Interleukin-13; IL-13; antibody; canine; inhibitor; immune response; immunoregulation; tumour; cancer; autoimmune disease; vaccine; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1269 BP; 302 A; 320 C; 340 G; 307 T; 0 other;

interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony stimulating factor (GMCSF), and nuclectides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense obligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1094

sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Filt-3 ligand, canine or feline CD46, canine or
feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline
IL-4, canine or feline Filt-3 ligand, canine IL-13, feline
IL-4, canine or feline filt-3 ligand, canine IL-13, feline
colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, may be used as
vaccines for therapeutic or prophlactic regulation of an immune
response in animals (particularly cats, days, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
cucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300

Sequences 25552-255560 and 255561-255566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine and 78 respectively. The invention relates to canine CDL4, canine or feline CDL5 (IL-4, canine or feline CDL5 (IL-4, canine or feline CDL5) feline (IL-4, canine or feline CDL5) feline construction and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated colons for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while considered as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for and and antipors of activity, while the antibodies may be used in detection, and the constitution and activity, while the antibodies may be used in detection,

coquences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
LL-4, canine or feline Fit-13 ligand, canine or feline CD154 (CD40 ligand), canine IL-13, feline
LL-4, canine or feline Fit-1 aligand, canine IL-13, feline
colory-stimulating factor (GMSE), and nucleotides which encode these
interferon-alpha (IFN-alpha) and feline granulocyte macrophage
colory-stimulating factor (GMSE), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
colories for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and

allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antiquen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

                                                                                                                            and 78 respectively. The invention relates to canine IL-4, canine or feline Flt-3 ligand, canine or feline CD54 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including

                                                                                                                                                                                                                                                   Sequences encoding canine interleukin-13 (11-13) clones 80
and 78 respectively. The invention relates to canine
11-4, canine or felline Fil-3 ligand, canine or felline CD40, canine or
felline CD154 (CD40 ligand), canine 11-5, canine L1-13, felline
colony-stimulating factor (GMCSF), and mucleotides which encode these
interferon-alpha (IFN-alpha) and felline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
immunoregulatory proteins. The prophlactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      agcoctytgactccctccccaaccctcaaggagctcattgaggagctggtcaacatcacc 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 agccctgtgactccctcccaaccctcaaggagctcattgaggagctggtcaacatcacc 60

sequences encoding canine interleation. It is clones 80
and 78 respectively. The invention relates to canine
25 IL-4, canine or felline Fit-13 ligand, canine or felline CD40, canine or felline CD154 (CD40 ligand), canine IL-5, canine IL-13, felline
26 interferon alpha (IFN-alpha) and felline granulocyte macrophage
27 colony-stimulating factor (GMCSF), and nucleotides which encode these
28 interferon alpha (IFN-alpha) and felline granulocyte macrophage
29 colony-stimulating factor (GMCSF), and nucleotides which encode these
20 inmunoregulatory proteins. The proteins, their associated
20 nucleic acids, specific antibodies and inhibitors may be used as
20 response in animals (particularly cats, dogs, horses and humans).
21 They may be used to treat autoimmune or infectious diseases including
22 allergies, tumours, inflammation and graft rejection, and to increase
23 the response from a co-administered antigen. The nucleotide sequences
24 can also be used for the recombinant production of a protein, while
25 nucleotide fragments are useful as probes, as amplification primers and
26 as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
26 modulators of activity, while the antibodies and to screen for
27 and also be used to raise antibodies and be used in detection,

sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline FIL-3 ligand, canine or feline CD40, canine or
feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline
interferon-1apha (IFN-alpha) and feline granulocyte macrophage
clony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucletc acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
response from a co-administered antigen. The nucleotide sequences
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and

and 78 respectively. The invention relates to canine or feline CD40, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ligand), canine IL-5, canine IL-13, feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline cointerferon-alpha (IFN-alpha) and feline granulocyte macrophage of interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunor-acquiatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans).

They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).

The proteins may be used to raise antibodies and to screen for andulators of activity, while the antibodies may be used in detection,

Sequences 25552-25560 and 25561-25566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine of feline correctively. The invention relates to canine or feline or feline FIL-3 ligand, canine or feline CDD40, canine or feline or feline FIL-3 ligand, canine or feline corrective corrective corrective corrective corrective corrective corrective corrective corrective macrophage interferon-alpha (FRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins which encode these immunoregulatory proteins. The proteins and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

present invention

RESULT 15

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinfinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, central nervous sand non-nervous system correctors, and peripheral nervous and non-nervous system receptors, binding proteins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergic fibrosis (CF), allergic ribinitis (AR), pulmonary when envisemed the condition embreamed the condition embreamed the condition embreamed the condition embreamed the condition of the conditi Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension: emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis; hypertension, emphysema, chronic obstructive pulmonary disease (COPD), upulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. F18434 to F21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -Human low adenosine antisense oligonucleotide related sequence #2901 Disclosure; Page 1336; 1592pp; English. 24-MAR-2000; 2000WO-US08020.                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 3, A Sequence 3, A Sequence 12, Sequence 10, Sequence 11,
